## **AMENDMENTS TO THE CLAIMS**

Please amend the claims as follows.

- (Currently Amended) A method for dynamically casting an object graph, comprising:
  creating an internal representation using a root object of the object graph;
  instantiating a cast object graph using a casting rule and the internal representation; and
  populating the cast object graph with an object, wherein a name of the object is modified
  in accordance with the casting rule.
- (Original) The method of claim 1, further comprising:
  instantiating a cast object graph attribute using the casting rule and the internal
  representation.
- (Original) The method of claim 1, further comprising:
  retrieving the root object using a variable usage specification.
- (Original) The method of claim 1, further comprising:
  obtaining a class definition, wherein the class definition is used to create the internal representation.
- 5. (Original) The method of claim 4, wherein the class definition is generated at runtime by a transport packager.
- 6. (Original) The method of claim 1, wherein the casting rule comprises a casting method.
- 7. (Original) The method of claim 6, wherein the casting method implements a mapping method.
- 8. (Original) The method of claim 6, wherein the casting method implements a suffix method.
- 9. (Original) The method of claim 6, wherein the casting method implements a parser method.
- 10. (Original) The method of claim 1, wherein the internal representation is a serialized file.

98909

11. (Currently Amended) A method for dynamically casting an object graph, comprising: retrieving a root object of the object graph using a variable usage specification; obtaining a class definition, wherein the class definition is used to create an internal representation;

creating the internal representation using the root object of the object graph; instantiating a cast object graph using a casting rule and the internal representation; populating the cast object graph with an object, wherein a name of the object is modified in accordance with the casting rule; and

instantiating a cast object graph attribute using the casting rule and the internal representation.

- 12. (Currently Amended) A distributed computer system, comprising:
  - a client;
  - a server operatively connected to the client;
  - a client-side transport packager located on the client;
  - a server-side transport packager located on the server;
  - means for creating an internal representation using a root object of the object graph;
  - means for instantiating a cast object graph using a casting rule and the internal representation; and
  - means for populating the cast object graph with an object, wherein a name of the object is modified in accordance with the casting rule.
- 13. (Original) The distributed computer system of claim 12, further comprising: means for instantiating a cast object graph attribute using the casting rule and the internal representation.
- 14. (Original) The distributed computer system of claim 12, further comprising: means for retrieving the root object using a variable usage specification.
- 15. (Original) The distributed computer system of claim 12, further comprising: means for obtaining a class definition, wherein the class definition is used to create the internal representation.

98909 4

16. (Original) The distributed computer system of claim 15, wherein the class definition is generated at runtime by a transport packager.

- 17. (Original) The distributed computer system of claim 12, wherein the casting rule comprises a casting method.
- 18. (Original) The distributed computer system of claim 17, wherein the casting method implements a mapping method.
- 19. (Original) The distributed computer system of claim 17, wherein the casting method implements a suffix method.
- 20. (Original) The distributed computer system of claim 17, wherein the casting method implements a parser method.
- 21. (Original) The distributed computer system of claim 12, wherein the internal representation is a serialized file.
- 22. (Currently Amended) A distributed computer system, comprising:
  - a client;
  - a server operatively connected to the client;
  - a client-side transport packager located on the client;
  - a server-side transport packager located on the server;
  - means for retrieving a root object of the object graph using a variable usage specification;
  - means for obtaining a class definition, wherein the class definition is used to create an internal representation
  - means for creating the internal representation using the root object of the object graph;
  - means for instantiating a cast object graph using a casting rule and the internal representation;
  - means for populating the cast object graph with an object, wherein a name of the object is modified in accordance with the casting rule; and
  - means for instantiating a cast object graph attribute using the casting rule and the internal representation.

98909 .5

23. (Currently Amended) An apparatus for dynamically casting an object graph, comprising: means for retrieving a root object of the object graph using a variable usage specification; means for obtaining a class definition, wherein the class definition is used to create an internal representation;

means for creating the internal representation using the root object of the object graph;

means for instantiating a cast object graph using a casting rule and the internal representation;

means for populating the cast object graph with an object, wherein a name of the object is modified in accordance with the casting rule; and

means for instantiating a cast object graph attribute using the casting rule and the internal representation.
